1.TCP 的建立

```
13 vector<SOCKET> clients;
14 mutex clientsMutex;
15
16 void handleClient(SOCKET clientSocket) {
17     char buf[4096];
18
19     while (true) {
20         ZeroMemory(buf, 4096);
21
22         int bytesReceived = recv(clientSocket, buf, 4096, 0);
23         if (bytesReceived == SOCKET_ERROR) {
24             cerr << "Error in recv(). Quitting" << endl;
25             break;
26         }
27
28         if (bytesReceived == 0) {
29             cout << "Client disconnected " << endl;
30             break;
31         }
32
33         string clientMessage = string(buf, 0, bytesReceived);
34         cout << "From Client: " << clientMessage << endl;
35
36         // Broadcast the message to all clients
37         {
38             lock_guard<mutex> lock(clientsMutex);
39             for (SOCKET client : clients) {
40                 if (client != clientSocket) {
41                     send(client, clientMessage.c_str(), clientMessage.size() + 1, 0);
42
43                     // 获取并打印目标客户端的端口信息
44                     sockaddr_in clientInfo;
45                     int clientInfoSize = sizeof(clientInfo);
46                     getpeername(client, (sockaddr*)&clientInfo, &clientInfoSize);
47                     cout << "Broadcast message to client on port: " << ntohs(clientInfo.sin_port) << endl;
48                 }
49             }
50         }
51     }
52
53     // Remove client from the list and close the socket
54     {
55         lock_guard<mutex> lock(clientsMutex);
56         clients.erase(remove(clients.begin(), clients.end(), clientSocket), clients.end());
57     }
58 }
```

```
9     sockaddr_in hint;
10     hint.sin_family = AF_INET;
11     hint.sin_port = htons(54000);
12     hint.sin_addr.S_un.S_addr = INADDR_ANY;
13
14     bind(listening, (sockaddr*)&hint, sizeof(hint));

```

客户端:

```
private fun connectToServer(buttons: List<Button>) {

    //buttons[0].backgroundTintList = ColorStateList.valueOf(Color.parseColor("#669900"))
    CoroutineScope(Dispatchers.IO).launch { this: CoroutineScope
        try {
            val socket = Socket("192.168.10.227", port: 54000)
            val output = PrintWriter(socket.getOutputStream(), autoFlush: true)
            val input = BufferedReader(InputStreamReader(socket.getInputStream()))

            // 发送数据到服务器
            output.println("Hello Server!")
            Log.d(tag: "SocketClient", msg: "Message sent to server: Hello Server!")

            // 读取服务器响应
            val buffer = CharArray(size: 4096)
            var response: String

            while (true) {
                val bytesReceived = input.read(buffer)
                if (bytesReceived == -1) {
                    Log.d(tag: "SocketClient", msg: "Connection closed by server.")
                    break
                }
                response = String(buffer, offset: 0, bytesReceived)

                Log.d(tag: "SocketClient", msg: "Message received from server: $response")
                val numericResponse = response.filter { it.isDigit() }
                val value = numericResponse.toInt()

                if (buttonColorChangeCount >= 3){
                    runOnUiThread {
                        buttonJoinSunface17.invalidate()
                    }
                }
            }
        }
    }
}
```

分爲主辦人和玩家 上面那張是玩家的 client 端，他只負責接受答案

而下面這張是主辦人的 client 端，只負責發答案

```
private fun connectToServer(buttons: List<Button>, number : String) {

    //buttons[0].backgroundTintList = ColorStateList.valueOf(Color.parseColor("#669900"))
    CoroutineScope(Dispatchers.IO).launch { this: CoroutineScope
        try {
            val socket = Socket( host: "192.168.10.227", port: 54000)
            val output = PrintWriter(socket.getOutputStream(), autoFlush: true)
            val input = BufferedReader(InputStreamReader(socket.getInputStream()))

            // 发送数据到服务器
            output.println("$number")
            Log.d( tag: "SocketClient", msg: "Message sent to server: $number!")

            // 读取服务器响应
            val buffer = CharArray( size: 4096)
            var response: String

            while (true) {
                val bytesReceived = input.read(buffer)
                if (bytesReceived == -1) {
                    Log.d( tag: "SocketClient", msg: "Connection closed by server.")
                    break
                }
                response = String(buffer, offset: 0, bytesReceived)

                Log.d( tag: "SocketClient", msg: "Message received from server: $response")

                // else
                // println("$value failed")
            }
        }
    }
}
```

2. 界面 UI 設計

3 遊戲規則

玩家端先將 6 個號碼選擇好，然後按下 **start** 進入等待答案。
這時候主辦人會進來公佈答案 一個一個按鈕挑選，被挑選到的答案如果玩家有選擇，顏色則會立即變為綠色，如果沒有選擇則變為粉色，如果玩家得到了 4 個綠色的答案則宣佈過關。
